

# Ship Noise in Australia's Exclusive Economic Zone

Christine Erbe<sup>1</sup>, David Peel<sup>2</sup>, Renee Schoeman<sup>1</sup>, Joshua Smith<sup>3</sup>

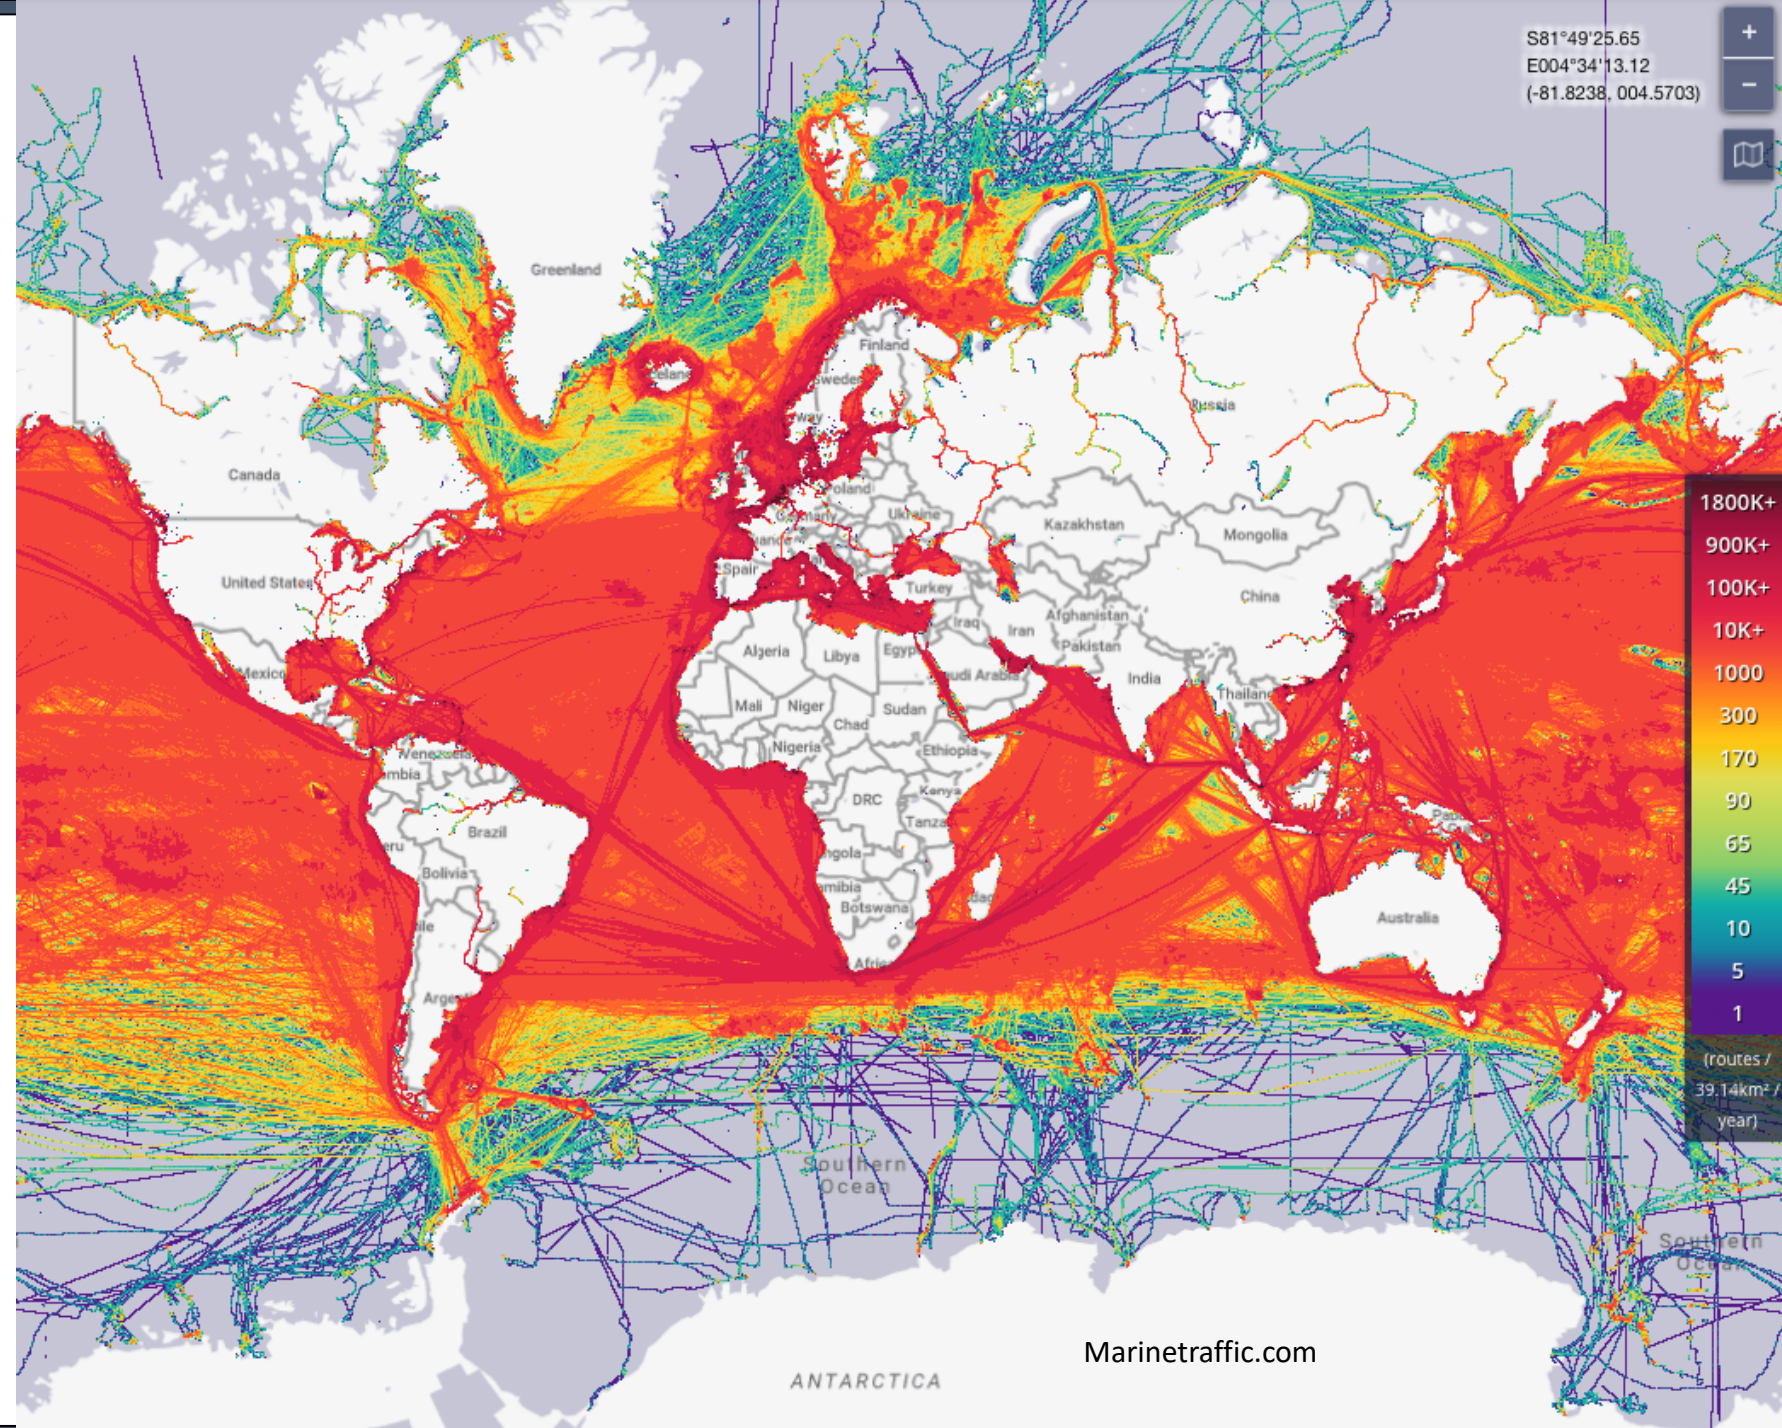

- 1 Centre for Marine Science and Technology, Curtin University, Perth, WA 6102, Australia
- 2 Data 61, CSIRO, CSIRO Marine Laboratories, Hobart, TAS 7004, Australia
- 3 Centre for Sustainable Aquatic Ecosystems, Harry Butler Institute, Murdoch University, Perth, WA 6150, Australia

This Marine Biodiversity Hub project was funded by the Australian Government's National Environmental Science Program.

## Aim:

# Determine the amount of ship noise in the Australian EEZ

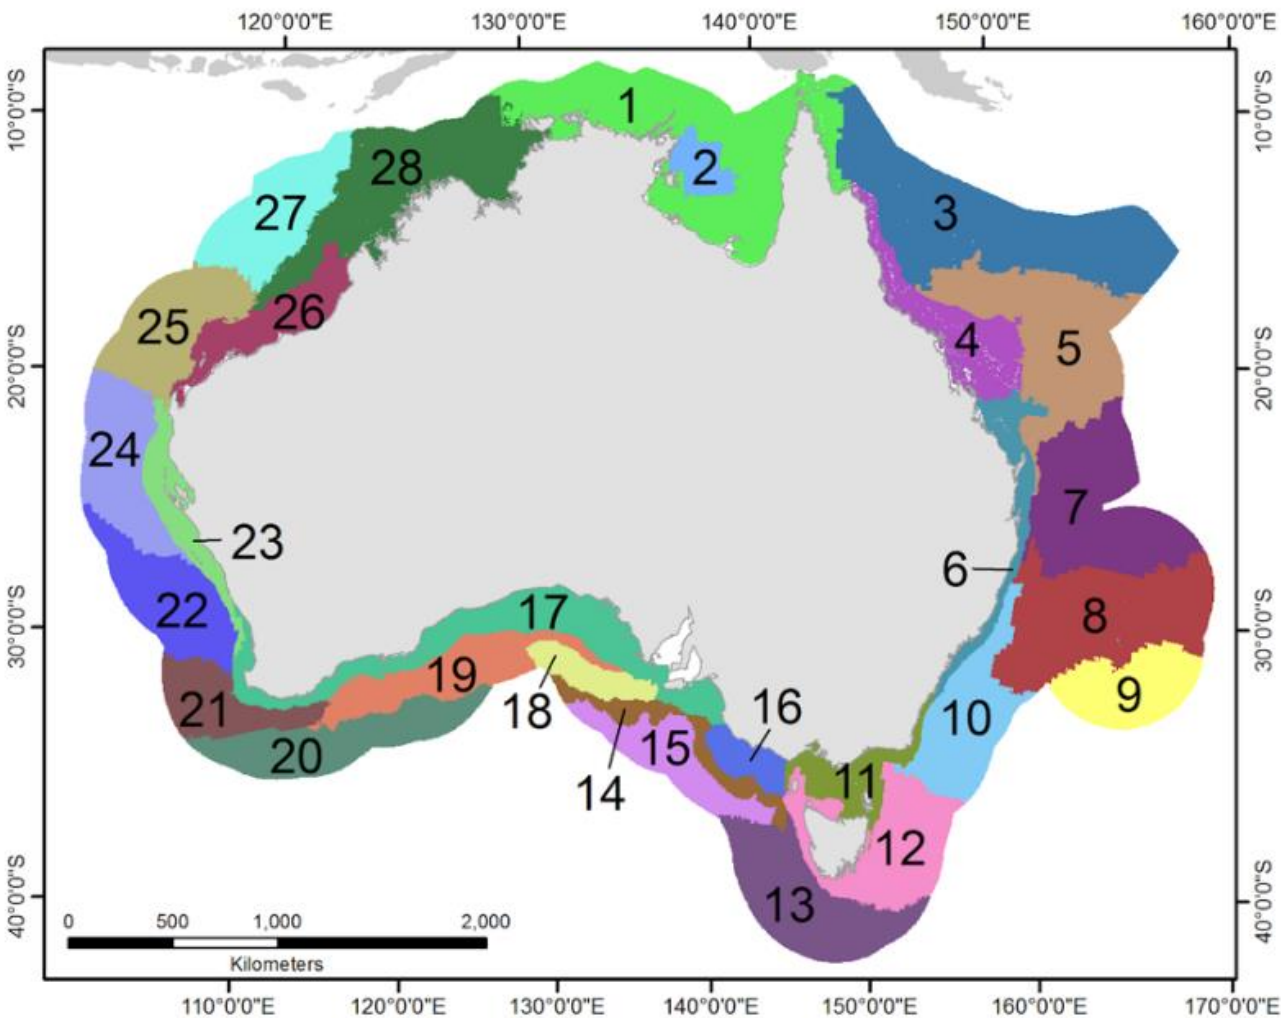

Problem:

Very large area to  
model, measure,  
monitor, assess

# Marine Acoustic Zones of Australia

|              | Derived Variable  | Input Variable          |
|--------------|---|-------------------------|
| Water Column | sea surface temperature   | sea surface temperature |
|              | sea surface salinity  | sea surface salinity    |
|              | sound speed gradient profile  | sound speed profile     |
| Seafloor     | compressional sound speed, shear sound speed, compressional absorption coefficient, shear absorption coefficient, density | % clay                  |
|              |   | % silt                  |
|              |   | % sand                  |
|              |   | % gravel                |
|              | sediment thickness  | sediment thickness      |
| Bathymetry   | bedrock type  | bedrock type            |
|              | water depth   | water depth             |

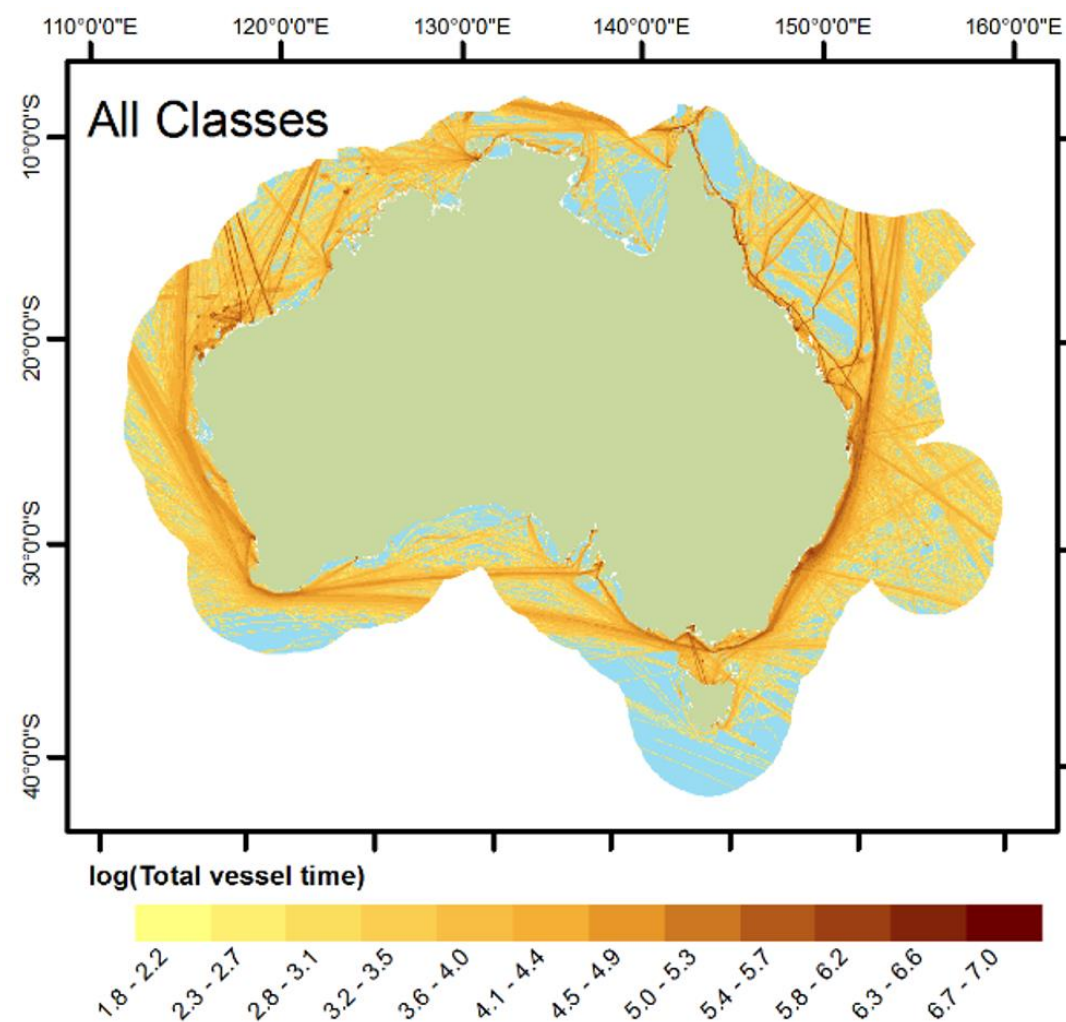

Erbe, C., Peel, D., Smith, J. N., and Schoeman, R. P. (2021). Marine acoustic zones of Australia. *Journal of Marine Science and Engineering*, 9(3), 340, doi: 10.3390/jmse9030340.

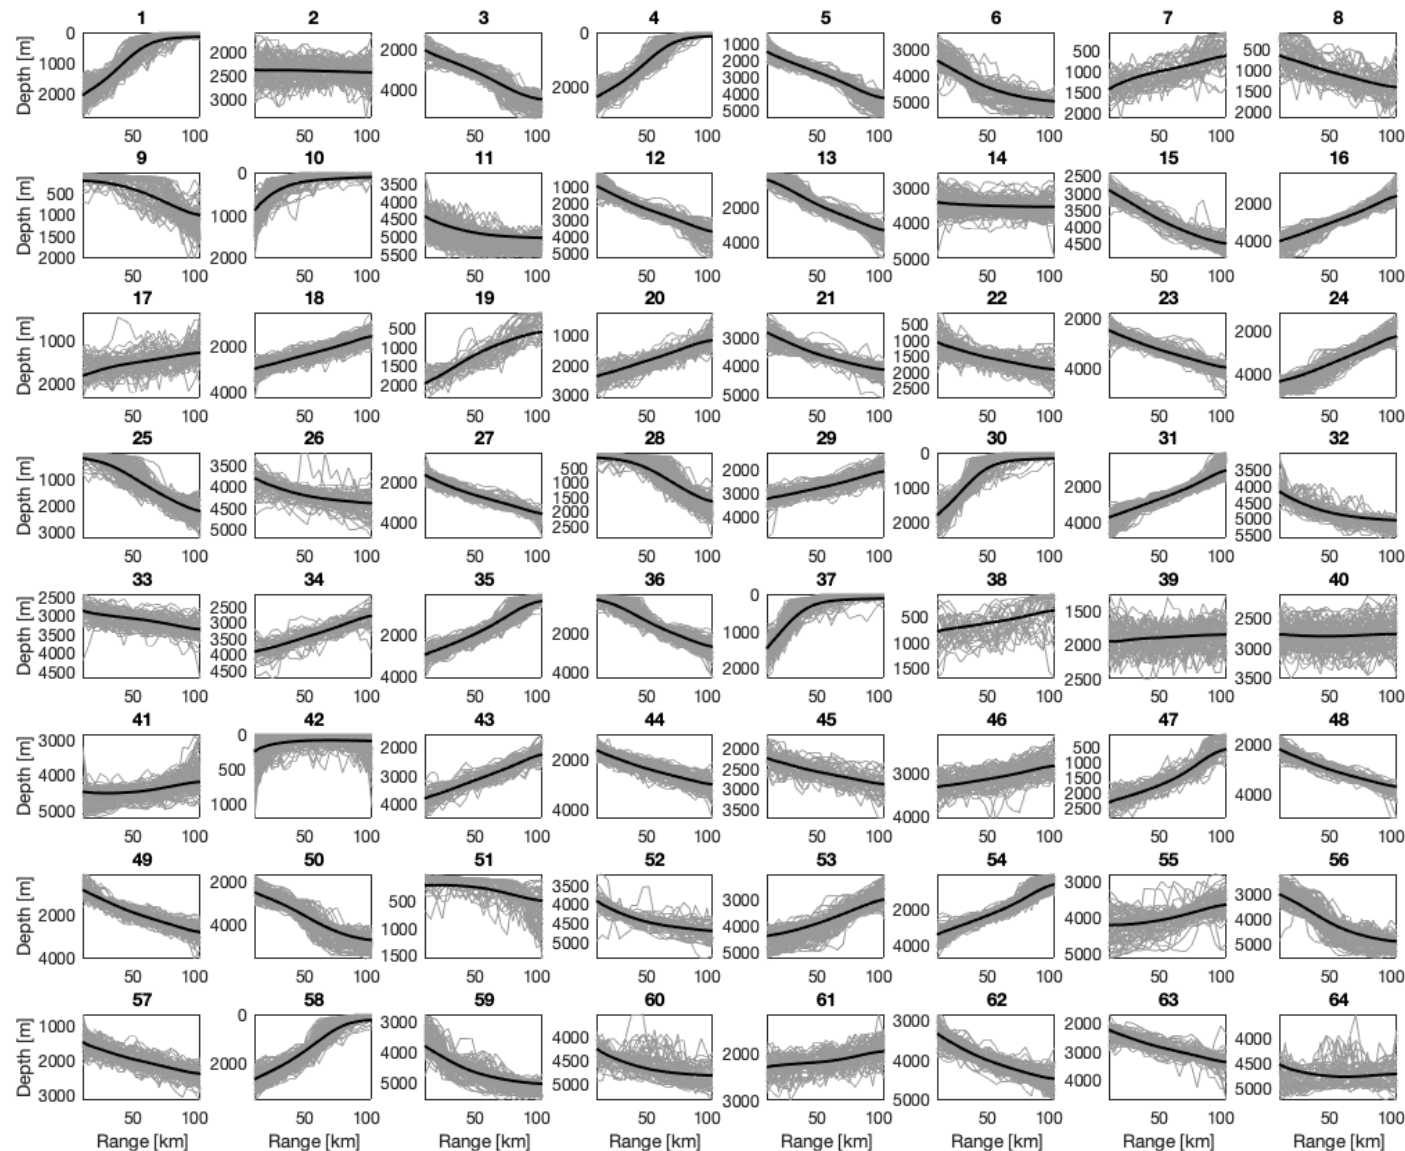

# Ship Noise in Australia

1. Within each acoustic zone
2. Plot ship AIS data
3. QC, clean, interpolate
4. Grid AIS data on a 5 km x 5 km chart
5. Accumulate time spent in each cell over 6 winter months, by ship class
6. Ship length classes: <25 m (1),  $\geq 25$ –<50 m (2),  $\geq 50$ –<100 m (3),  $\geq 100$ –<200 m (4), and  $\geq 200$  m (5)
7. Define ship source spectra by class

# Ship Noise in Australia

1. Within each acoustic zone
2. Plot ship AIS data
3. QC, clean, interpolate
4. Grid AIS data on a 5 km x 5 km chart
5. Accumulate time spent in each cell over 6 winter months, by ship class
6. Ship length classes:  $<25$  m (1),  $\geq 25$ – $<50$  m (2),  $\geq 50$ – $<100$  m (3),  $\geq 100$ – $<200$  m (4), and  $\geq 200$  m (5)
7. Define ship source spectra by class
8. Extract source-receiver transects over  $360^\circ$  and 100 km range from each source cell
9. Cluster bathymetry transects (self-organising neural network + k-means)

# Ship Noise in Australia

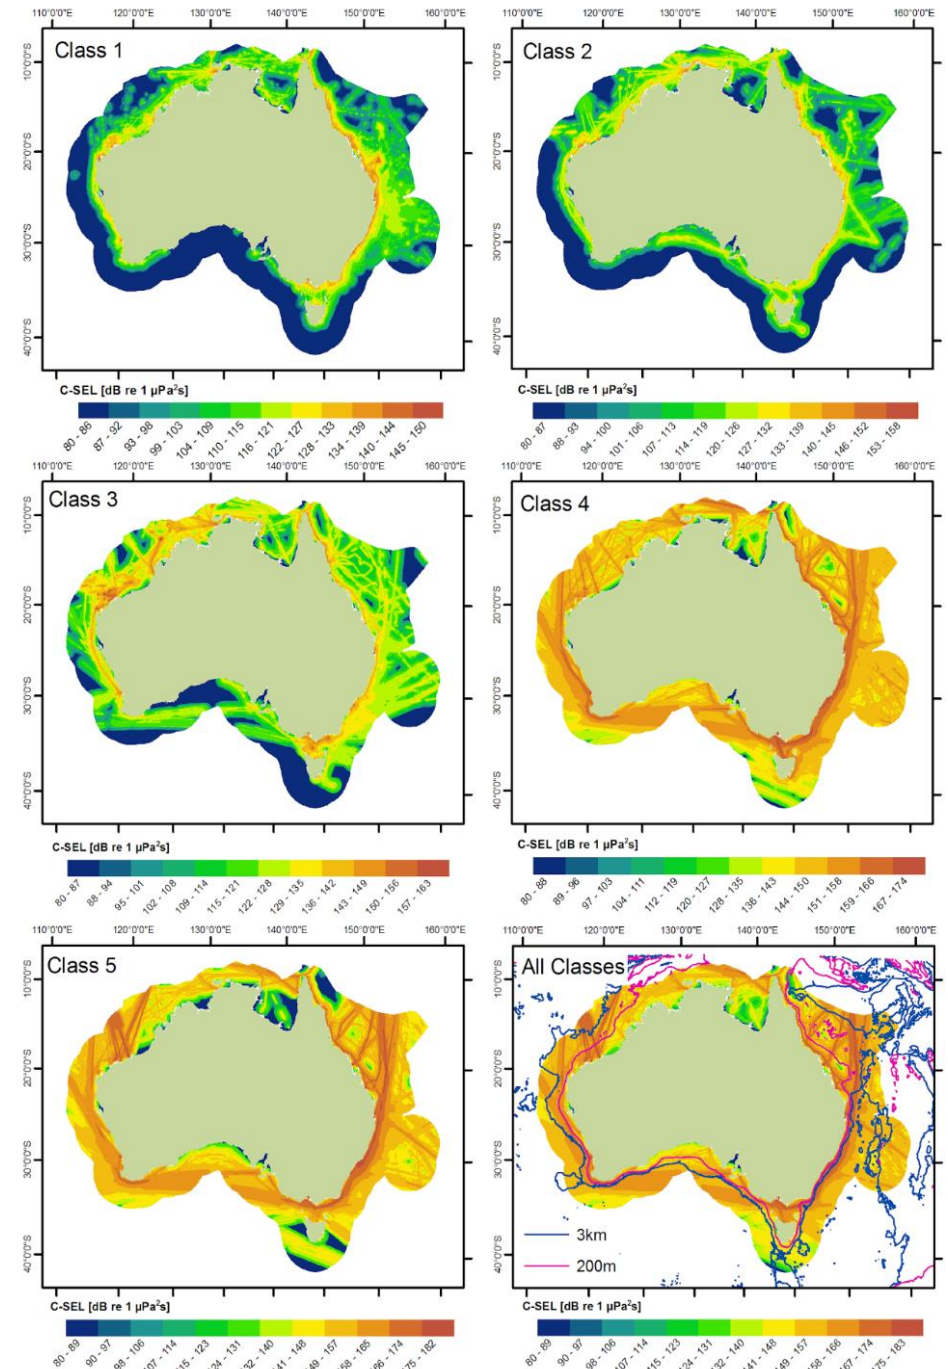

1. Within each acoustic zone
2. Plot ship AIS data
3. QC, clean, interpolate
4. Grid AIS data on a 5 km x 5 km chart
5. Accumulate time spent in each cell over 6 winter months, by ship class
6. Ship length classes:  $<25$  m (1),  $\geq 25$ – $<50$  m (2),  $\geq 50$ – $<100$  m (3),  $\geq 100$ – $<200$  m (4), and  $\geq 200$  m (5)
7. Define ship source spectra by class
8. Extract source-receiver transects over 100 km range from each source cell
9. Cluster bathymetry transects
10. Model sound propagation along bathymetry centroids

# Ship Noise in Australia

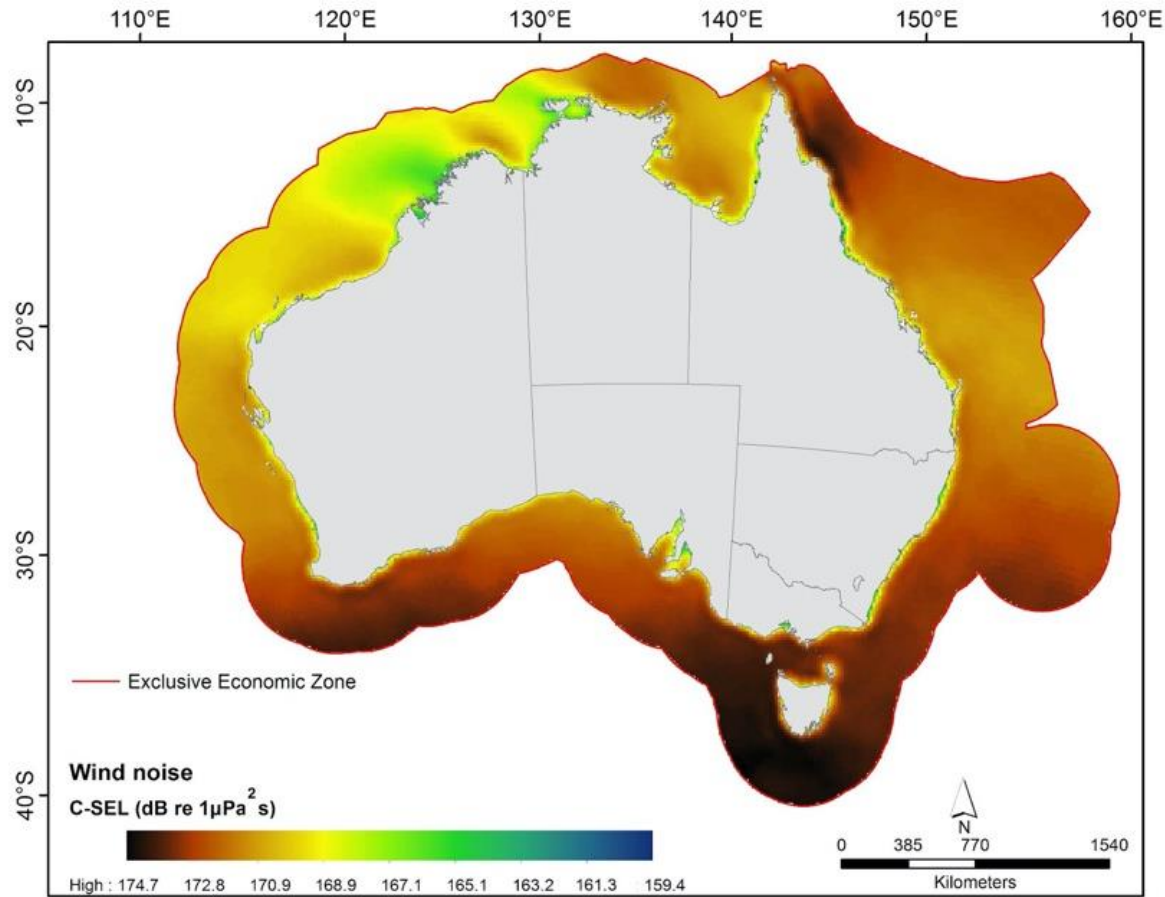

1. Within each acoustic zone
2. Plot ship AIS data
3. QC, clean, interpolate
4. Grid AIS data on a 5 km x 5 km chart
5. Accumulate time spent in each cell over 6 winter months, by ship class
6. Ship length classes:  $<25$  m (1),  $\geq 25$ – $<50$  m (2),  $\geq 50$ – $<100$  m (3),  $\geq 100$ – $<200$  m (4), and  $\geq 200$  m (5)
7. Define ship source spectra by class
8. Extract source-receiver transects over 100 km range from each source cell
9. Cluster bathymetry transects
10. Model sound propagation along bathymetry centroids
11. Apply propagation loss to all source-receiver transects
12. Accumulate sound exposure over time, ship class, zone, EEZ

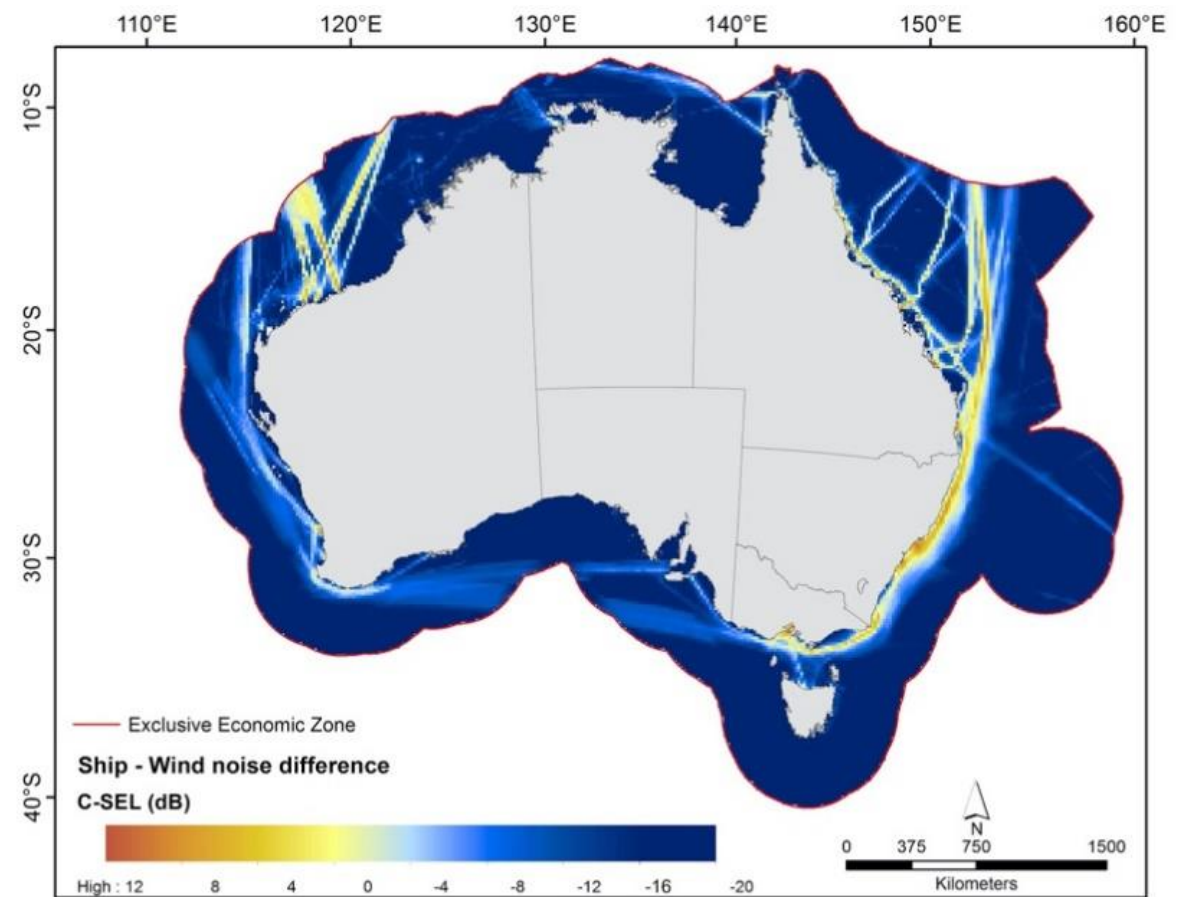

# Model Wind Noise in Australia – for comparison

## Wind Noise Underwater

## Ship – Wind Noise

# Validate with 25 6-month recordings

| Location          | Long  | Lat   | Winter d | C-SEL [dB re 1 μPa2s] measured | SPL [dB re 1 μPa] measured | Ship C-SEL [dB re 1 μPa2s] modelled | Wind C-SEL [dB re 1 μPa2s] modelled | Ship+Wind C-SEL [dB re 1 μPa2s] modelled | C-SEL difference measured - modelled [dB] | Notes  |

| NW Shelf         | 121.9 | -14.1 | 2008     | 192                           | 120                        | 140                                 | 167                                 | 167                                      | 25  | dominated by industrial noise at the time  |

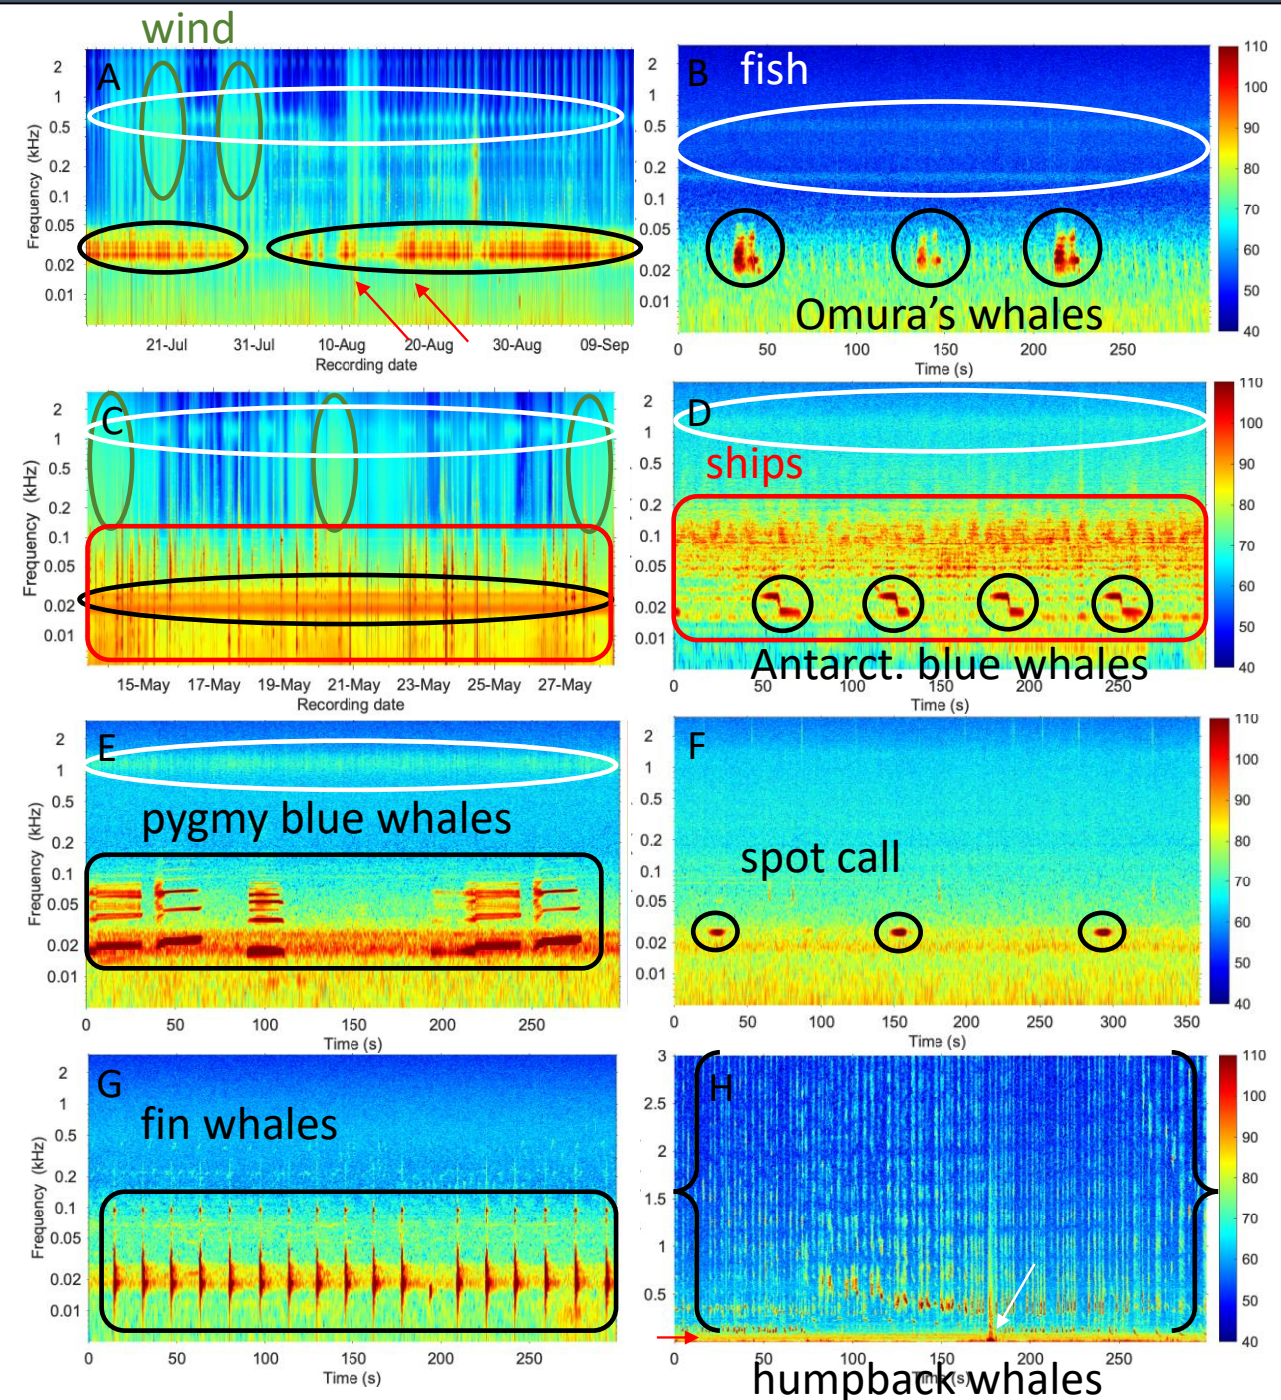

No ships

- Good agreement between model and measurement when the only sources were ships and wind.
- Animal choruses seasonally and regionally dominate the Australian marine soundscape.
- Strong winds dominate along Australia's southern coast.
- Ship noise dominated near the major shipping lanes and ports.
- Other industrial noise dominate(s/d) regionally and temporarily.
- Pristine (= dominated by natural, geophysical and biological sources) soundscapes remain in several places.
- Must not look at one source at a time, but consider any one source in the context of the local soundscape.

Erbe, C., Schoeman, R. P., Peel, D., and Smith, J. N. (2021). It often howls more than it chugs: Wind versus ship noise under water in Australia's maritime regions. *Journal of Marine Science and Engineering*, 9(5), doi: 10.3390/jmse9050472.

*Thank you!*
